Title : Several Properties of the Japanese Cinnamon as Medicinal Raw Material.

Orig Pub : Tr. Tbililissk. med. in-ta, 1957, 11, 47-62

Abstract : A study was made of the Japanese cinnamon (*Cinnamomum pedunculatum* Presl), which grows on the Black Sea coast, as a possible raw material containing a substitute for the imported cocoa butter. Its heavy fat was complete suitable for the preparation of candles and balls according to the prescriptions of the Pharmacopeia of the USSR (8th). The butter and preparates from it are kept at a temperature not higher than 28°. Aside from the fat

Cinnamon (*Cinnamomum Pedunculatum* Presl.).

Orig Pub : Soobshch. AN GruzSSR, 1956, 17, No 10, 913-120

Abstract : The solid fat content of the fruit of the Japanese cinnamon (*Cinnamomum pedunculatum* Presl.) growing on the littoral of the Black Sea, on the basis of its physico-chemical properties, appears to be suitable as a substitute base material in replacing cacao butter imported into the Soviet Union. The fruit formation of the Japanese cinnamon, the determination of the location in plants of accumulations of essential and aliphatic oils, and the chemical nature of other matters contained in the fruits are described.

Title : For a wider use of prefabricated reinforced concrete parts
and structures in hydro-power construction

Periodical : Gidr. stroi., v.24, no.2, 1-2, 1955

Abstract : The use of prefabricated reinforced concrete is strongly
recommended in the construction of auxiliary shops,
housing facilities and in some structures of hydro-
power developments, i.e. floors of powerhouses of small
and medium capacity, control towers of navigation locks,
numbers of bridges and construction trestles, etc.
Insufficient facilities for the manufacturing of pre-
fabricated concrete at construction sites and the lack
of experience of workers is criticized.

Translation from: Referativnyy zhurnal. Elektrotehnika, 1959, Nr 4, p 40 (USSR)

AUTHOR: Eristov, V. S.

TITLE: Advancement of Hydro-Engineering Science in the USSR

PERIODICAL: V sb.: Energ. str-vo SSSR za 40 let. M.-L., Gosenergoizdat, 1958, pp.64-70

ABSTRACT: A list of research institutes organized in the USSR since 1918 which contributed to a high level of hydro-engineering science is submitted. The domain of work and principal results are indicated for each institute. Automation and remote control have been widely adopted; concrete plants, water-table-lowering systems, dredge control, etc., are automated; radioactive isotopes are used for checking welds, concrete, and pulp consistency; ultrasonic flaw detection, etc., is also used.

Title : A Contribution to the Question of the Vascularization of the
Thyroid Gland In Man. Communication I.

Orig Pub : Uch. zap. Tortusk. un-ta, 1956, vyp. 40, 53-62

Abstract : A study was made of the interlobular and intralobular vessels and of the capillary network of the human thyroid gland on the specimens with the blood vessels which were naturally injected with erythrocytes (the sections of 14 cases of asphyxia were used). Wide and short (100-200 microns) intra-lobular arterioles were found which did not anastomose but formed wide looped capillary networks (12-22 microns in diameter). They form anastomoses with each other and empty into numerous thin-walled broad venules in contiguous follicles. Interlobular veins are almost completely devoid of the circular muscle fibers. No arteriovenous anastomoses were found in

Apparatus for Analyzing the Quality of Products During the Flow (Pribory dlya analiza kachestva produktov v potoke)

PERIODICAL:

Priborostroyeniye, 1959, Nr 2, pp 25 - 27 (USSR)

ABSTRACT:

Automatic Refractometer.
The apparatus RAN-57 is intended to serve for analyzing quantitatively a composition of 2 substances at the processing of petroleum or chemical products or also of food-stuffs. The increment Δn is recorded in comparison to a standard. A light beam penetrates both a cuvette filled with a standard solution and a cuvette containing the sample. Both cuvettes are separated by a molten quartz screen. In the case where in the cuvettes are liquids with different refraction indices n the beam is deflected by 2 prisms to 2 photocells. The voltage difference at the output of these two photocells is increased and used for actuating an electric motor. This motor is kept in operation as long as both prisms come into that position where both photocells are lighted with the same brightness. If this is attained a dial gage connected with a potentiometer, type EPP-09

Card 1/6

Apparatus for Analyzing the Quality of Products During
the Flow

SOV/119-59-2-11/17

indicates the position "0". For safety reasons, the entire apparatus is housed in an airtight case. The accuracy of measurement amounts $\pm 2 \cdot 10^{-2}n$ (n - refraction index). The apparatus is equipped with a thermostat keeping the test liquid on $20 \pm 2^\circ\text{C}$. The apparatus was developed by A. M. Ruvinskiy and V. S. Sukhomlinov.

Apparatus for automatically detecting petroleum in water. The apparatus serves for automatic analysis of the quantity of oil or petroleum refining residue in the sewage of petroleum refineries. The test results are graphically recorded. By means of this apparatus PONV-57 samples are automatically taken out of the sewage and supplied to the apparatus. The distance between apparatus and the place where the samples are taken should not be longer than 400 m. The measuring method is the following: when an ultraviolet ray passes through a cuvette containing the sample and through a cuvette containing the standard solution, a luminescence of different intensity in each of them is excited. The luminescent radiation arrives at a multiplier FEU-17 in which the light energy is transformed into electric

Card 2/6

Apparatus for Analyzing the quality of Products During
the Flow

SOV/119-59-2-11/17

currents. These are now recorded by the potentiometer EPP-09. The apparatus PONV-57 consists of 4 sets and is apt for detecting the presence of petroleum residues of 200-250 mg/l in the sewages. The accuracy amounts $\pm 10\%$ and the connected value is 2 kW. The development of this apparatus was supervised by L. A. Imanuilov.

Automatic colorimeter. The automatic colorimeter AKN-57 works on the following principle: a light ray is directed through two optically equal channels to a photomultiplier. A disk is inserted into the path of the beam rotating at a speed of 1300 rpm. The disk is provided with 2 series of holes arranged in such a way that the beam passing through the standard cuvette arrives, for example, through the lower series of holes at the multiplier. The beam passing through the test cuvette comes to the multiplier through the upper series of holes. At normal operation the luminous flux of both channels is recorded and the resulting photocurrent is of sine-shape and wears single prongs. These signals are after their amplification conducted to the potentiometer EPP-09. The potentiometer amplifier works with 2 valves the

Card 3/6

Apparatus for Analyzing the Quality of Products During
the Flow

SOV/119-59-2-11/17

one serving as amplitudevoltage meter and the other one as rectifier. The amplifier transformers are such dimensioned that, at the same light absorption in both cuvettes, the impulse amplitude given on one grid is equal to the amplitude of a sine voltage supplied to the grid of the 2nd valve. Due to this, at the cathodes of the valves of the amplitude voltage meter constant voltages will occur. One of them is proportional to the impulse amplitude the other one to the amplitude of the a.c.component. The d.c.voltages are now transmitted to the next valve, i.e.the rectifier. In case the color intensity of the petroleum sample varies,different voltages will be conducted to the rectifier and consequently an alternating component which starts the motor of a rheostat will occur at the transformer output. The rotation of the rheostat lasts until this alternating component disappears. The apparatus is housed in a safety case. It consists of the colorimeter, the potentiometer EPP-09, the stabilizer ST-250 and a 220/127 V transformer and was developed by V. O. Bukler, I. Ya. Shapiro, and I. L. Krymskiy. Apparatus for automatic determination of the flash point of petroleum products. By means of the

Card 4/6

Apparatus for Analyzing the Quality of Products During
the Flow

SOV/119-59-2-11/17

apparatus PAVN-57 the flash point of different petroleum products lying between 25 and 130°C can be measured. The main part of the device consists in the explosion chamber which at certain time intervals is filled automatically with the petroleum product to be tested. The petroleum product is heated by an electric heater. When the mixture petroleum product - air attains a certain concentration it is ignited by an electric spark. ~~The flash point~~ and the temperature are recorded by the potentiometer EPP-09. After the ignition, the explosion chamber is rinsed by compressed air and then re-filled. The temporal course of the test procedure is controlled by a timing relay. Rinsing the chamber needs 13 s and filling it with the new sample 17 s. The determination of the flash point, depends on the ignitability of the sample and requires 1-10 minutes. For one test, 70 ml of the petroleum product are necessary. The apparatus is also apt for determining the deviation of the flash point from a given value by means of a thermocouple built in into the explosion chamber. The entire device consists of the apparatus PAVN, the control desk, the potentiometer EPP-09 and the rationing equipment.

Automatically Recording Medical Instruments
(Samopishushchiye meditsinskiye pribory)

PERIODICAL:

Priborostroyeniye, 1959, Nr 4, pp 30-31 (USSR)

ABSTRACT:

The multichannel hemodynamical oscillograph of the type GOE-01 with a photographic recorder has been developed by the staff of the KTL "Biofizpribor" by order of the Institut terapii Akademii meditsinskikh nauk SSSR (Institute of Therapy of the Academy of Medical Sciences USSR). This instrument can be used for the comprehensive investigation of the functional state of peripheral blood circulation. The quantities which can be measured with this instrument are enumerated. This apparatus also provides for a simultaneous measurement of the pressure in two arteries according to the oscillator method. Furthermore it is possible to measure the pressure in veins simultaneously in both hands or legs (according to the volumetric method). The apparatus GOE-1 also makes possible the recording of pulse curves at three points, and also the recording of one of the following variants of an electrocardiogram : I, II, III, aVL, aVR, aVF, cV.

Card 1/3

Automatically Recording Medical Instruments

SOV/119-59-4-16/18

The channels of the instrument (with the exception of the electrocardiographic one) are all designed on the principle of the transformation of a variable pressure into corresponding capacity changes of a specially designed condenser manometer. The instrument GOE-01 is also suited to scientific research work as well as to clinical practice in the diagnosis and the curing of heart- and circulatory diseases. It is a portable unit with a size of 1220 . 460 . 830 mm and with a weight of approximately 100 kg. The second part of this article treats of an instrument for the uninterrupted and automatic control of the heart and circulatory system during surgical operations. This instrument (of the type SKhE-01) has been developed by the staff of the KTB "Biofizpribor" by order of the Institut khirurgii Akademii meditsinskikh nauk SSSR (Institute of Surgery of the Academy of Medical Sciences USSR) from 1955 to 1957. It is suited for the uninterrupted and automatic control and the recording of the activity of the heart and the circulatory system and of respiration during surgical operations on the heart, of the brain and on other human organs. It can be used for scientific research work and animal experiments. The instrument of the type SKhE-01 is a portable

Card 2/3

Automatically Recording Medical Instruments

SOV/119-59-4-16/18

electric multichannel instrument with a size of 925 . 670 . 775 mm and a weight of 80 kg. It is supplied from a. c. mains with 127 or 220 V \pm 10% and a frequency of 50 \pm 1 cy. It takes about 600 watts from the supply. Finally the limits of the measuring ranges of this instrument are given. There are 2 figures.

TITLE:

The Ultrasonic Viscosimeter of the Type UZV-58

PERIODICAL:

Priborostroyeniye, 1960, Nr 3, pp 26-27 (USSR)

ABSTRACT:

The viscosimeter described here is intended for the permanent checking of viscosity of liquids in various branches of industry. It is based upon the measurement of the reaction of the liquid to be measured on a plane plate oscillating with ultrasonic frequency. By the vibrating plate shear waves (sdvigovyye volny) are excited in the liquid, which act upon the plate like a braking force. This force is a function of the viscosity and consistence of the liquid. Two varieties of this instrument are described. The block diagram of the first instrument is shown in figure 1. It operates with magnetostrictive transmitters and receivers, and the signal received by coil 2 (Fig 1) is amplified and conveyed to the measuring instrument. The second variety renders it possible to compare the viscosity of a liquid to be measured with that of a standard liquid (Fig 2). In this case it is possible, under certain

Card 1/2

conditions, to neglect temperature influences. Details concerning the assembling of this instrument are given, and the fact is stressed that the distance between the two measuring heads which measure the viscosities, may amount up to 100 m. The instruments may be used at temperatures of up to 120°C. There are 2 figures.

TITLE: ~~Iron for Bushings of Deep-well Pumps and its Heat Treatment~~
(Chugun dlya vtulok glubinnykh nasosov i yego termicheskaya obrabotka)

PERIODICAL: Materialy Mezhvuz. nauchn. soveshchaniya po vopr. novoy tekhn. v nef. promsti, 1958, Vol 3, pp 201-205

ABSTRACT: An investigation was conducted with the purpose of developing a material and the development of a technological process for manufacturing bushings (B) for a deep-well pump that would make it possible to increase the life of the pump and simplify the whole procedure of its manufacture. The material which ensures the formation of cementite throughout the B in the centrifugal casting into the chill mold is an iron with an average chemical composition (in %) of C 2.7, Mn 1.0, Si 1.0. Bushings which after casting exhibit a completely pearlitic-ledeburitic structure without graphite inclusions are subjected to malleablizing for the duration of ~28 hours. After the malleablizing all the B are checked for H_B , which should be

Card 1/2

Reaction of hexahydroanthracene under conditions of catalytic hydrogenation. A. I. Shulkin, E. A. Brivanskaya, and V. V. Komarov. *Soviet Union, Moscow, Zhur. Obshch. Khim.* 26, 2582-7 (1956). Transformation of MeOPh over γ -Alumina catalyst (cf. Shulkin, *et al.*, C.A. 47, 1214c; Zeliniskil and Komarevskii, C.A. 18, 2855) was studied at 165°, 185°, 215°, and 240° at atm. pressure and under 50 or 155 atm. H₂. At atm. pressure MeOPh undergoes hydrogenolysis at Ph-O and at Me-O links, as well as isomerization to α -cresol. Hydrogenation under 50 atm. H₂ and 160° yields hexahydroanthole, 85.5%, bp 132.2-3.4°, d_4^{20} 0.8799, n_D^{20} 1.4348. At 215-10° the main reaction products are CH₄, some CO, PhOH, α -cresol, C₁₀H₈, cyclohexane, and olefins. At 215° hexahydroanthole cleaves completely to cyclohexane, CH₄, and H₂O with formation of some CO, olefins, CO, H₂, and CH₄. At atm. pressure the products are MeOH, PhOH, α -cresol, and cyclohexane.

TITLE: Catalytic Hydrogenation of Phenols ✓

PERIODICAL: Uspekhi khimii, 1960, Vol.29, No. 5, pp. 648-668

TEXT: An investigation of catalytic transformations occurring in the hydrogenation of phenols separated from higher fractions of primary resins, and in the hydrogenation of narrow fractions enriched in one or the other component was carried out. Sharp rectification- or chromatographic methods can be applied for separating these fractions. Previous research in the field of phenol transformation in hydrogenation is described in Refs. 1-8. Hydrogenation of phenols to hydroaromatic alcohols is discussed in Refs. 1, 9-91. Hydrogenations on platinum-, palladium-, copper-, and nickel catalysts are described. Hydrogenation of pure phenols can be carried out at comparatively low temperatures (up to 200°C) as well as at high- or atmospheric pressures in the presence of nickel- or platinum catalysts. Hydrogenation of industrial phenol mixtures is more difficult, owing to catalyst poisoning by sulfur-containing compounds. The reaction order of phenol hydrogenation is probably between zero and one. Which of the possible geometric isomers of the correspond-

Card 1/4

Catalytic Hydrogenation of Phenols

S/074/60/029/05/03/005
B008/B006

ing alcohol is formed, depends on hydrogenation conditions. Published data on the properties of cis- and trans-methyl cyclohexanols and melting points of their derivatives are given in Table 1. Hydrogenation of phenols to hydroaromatic ketones is described in Refs. 29, 66, 78, 92-101. In general, alicyclic ketones can be prepared by hydrogenating the corresponding phenols. Yields of these ketones, however, depend not only on hydrogenation conditions, the nature of the catalyst, and the amount of hydrogen adsorbed, but also on the structure of the initial phenol. The reduction of phenols to aromatic hydrocarbons is discussed in Refs. 5, 102-154. Catalysts based on molybdenum are generally applied. Experimental- and thermodynamic data indicate that a pressure drop during the hydrogenation of phenols in the presence of molybdenum catalysts increases the yields of aromatic hydrocarbons. The reaction, however, is slower and accompanied by considerable charring. At higher temperatures, phenols tend to give various condensation reactions. The formation of alicyclic hydrocarbons in the hydrogenation of phenols to the corresponding alcohols was observed by many investigators (Refs. 27, 28, 31, 66, 113, 118, 137, 140, 141, 149, 155-160). These hydroaromatic hydrocarbons, however, were only formed in small quantities as by-products of hydroaromatic alcohols. In order to obtain alicyclic hydrocarbons:

Card 2/4

80737

Catalytic Hydrogenation of Phenols

S/G 4/60/029/05/03/005
B073/B106

as main reaction product, the hydrogenation temperature must be chosen high enough to ensure dehydration of the alcohol. The behavior of polynuclear phenols in hydrogenation reactions has not been investigated widely (Refs. 107, 128, 136, 141, 158, 161-163). High-pressure hydrogenation of these compounds in the presence of molybdenum catalysts yields hydrocarbon mixtures containing aromatic-, hydroaromatic-, and various other hydrocarbons. Phenol formation is also observed. Refs. 6, 169-213 deal with the destructive hydrogenation of higher phenols, by which lower phenols are obtained. Thermodynamically, dealkylation of phenols is also possible. It can be effected by cracking higher phenols, or, by reacting higher phenols, without a catalyst at higher temperatures. Yields of lower phenols, however, are small. Several patents (Refs. 199-204) recommend destructive transformations of phenols to be carried out not only in the presence of metal oxides and metal sulfides, but also in contact with cracking catalysts. The direction of the reaction can be determined by choosing appropriate conditions and catalyst admixtures. The following persons are mentioned: V. V. Tishchenko, M. A. Belopol'skiy, B. L. Moldavskiy, I. B. Rapoport, S. Ye. Lifshits, A. V. Lozovoy, M. K. D'yakova, V. N. Ipat'yev, N. A. Orlov, M. F. Shostakovskiy, V. V. Shabarov, Ye. A. Viktorova, I. Ye. Pokrovskaya, A. I.

TITLE: Catalytic Dehydrocyclization of β -n-Butyl Naphthalene

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 133, No. 5,
pp. 1125 - 1127

TEXT: Of late, N. I. Shuykin (Refs. 4, 5) has proved that high-molecular alkanes of normal structure (e.g., hexa-, hepta-, and octadecanes) undergo dehydrocyclization under certain conditions. Condensed systems of naphthalene, phenanthrene, benzantracene and chrysene are then formed. In the work under consideration, the authors carried out the dehydrocyclization of β -n-butyl naphthalene to phenanthrene and anthracene. They established that, under the conditions applied here, a cyclization takes place at the α -carbon atom of the naphthalene ring, which is nearest to the butyl group. Phenanthrene is preferably formed in this case. The authors' experiments took place at 400°, 450°, 500°, and 550°C, aluminum chromium (20% of chromium oxide) being used as a catalyst. The catalyst was regenerated

Card 1/2

B016/B060

after each experiment. Table 1 gives the experimental results. It is stated that under the present conditions cracking does not play an important role. Their study has shown that β -n-butyl naphthalene in the presence of an aluminum-chromium catalyst easily undergoes dehydrocyclization at the β -carbon atom to form phenanthrene (70 - 80% of the theoretical yield). The anthracene yield does not exceed 1,5 - 2% in this case. The investigation is being continued for the dehydrocyclization of other β - and α -alkyl derivatives of naphthalene. Mention is made of papers by B. L. Moldavskiy, S. S. Nametkin, M. I. Khotimskaya, L. M. Rozenberg, and S. R. Sergiyenko. There are 1 table and 7 references: 5 Soviet and 1 US. X

TITLE: Infrared spectra of alkyl phenols and their simple ethers.
Report 5. Infrared spectra of some simple ethers of alkyl substituted phenols

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1963, 31, abstract 3D212
("Azerb. khim. zh.", 1962, no. 3, 67 - 73, summary in Azerb. language)

TEXT: Infrared spectra ($4,000 - 400 \text{ cm}^{-1}$) of some simple ethers of cresols and 3,4-xyleneol were obtained and examined. It was shown therein that the formation of ethers is accompanied by the disappearance of a number of bands, related to the oscillation of the hydroxyl group, and the appearance of intense bands $1,250 - 1,230$ and $1,180 - 1,150 \text{ cm}^{-1}$ in the region of valent oscillations of the C-O bond. In the spectra of methyl ethers of cresol a sharp decrease of the intensity of the bands of methyl groups is observed. The spectra of ethers in the long wave region are much richer than the spectrum of the initial cresols. The formation of an ether group brings about the activation of a series of os-
